On behalf of the Technical Program Committee, I welcome you to the 33rd International Photovoltaic Science and Engineering Conference (PVSEC-33) in Nagoya, Japan. The Technical Program Committee for this conference consists of 4 areas including total 9 sub-areas. All of research and development fields in photovoltaics science and technology are included in this conference. Scope of this conference is very wide from fundamental physic and chemistry, cell and module materials and processes, new applications, system-related issues, market and policy issues, and so on. The characteristic themes of PVSEC-33 are “extension” and “integration” for the new era of photovoltaics. Areas 1 and 2 cover the theme of “extension”. Areas 3 and 4 are based on the theme of “integration”. Other than separate sessions on different topics, we wish integrate common topics from different fields into shared sessions to facilitate the exchange of ideas.

More than 700 research papers were submitted from all over the world. The program was prepared by 115 Technical Program Committee members under the leadership of sub-area chairs. These members also selected 15 plenary speakers and 37 invited speakers. After fair review processes, about 200 contributed papers were selected to oral presentation. I greatly appreciate much efforts of all the Technical Program Committee members.

Finally, I am profoundly grateful to plenary and invited speakers, oral and poster presenters, and fruitful discussion with all the participants. The success of this conference is not achieved without their huge contribution.

We look forward to seeing you at PVSEC-33.

#### ◆Nagoya Castle◆

Nagoya Castle was completed in 1615 by the Shogun, Tokugawa Ieyasu. Topped with golden shachihoko, votive tiger-fish roof devices, and boasting the largest floorspace of any tower keep, Nagoya Castle and its magnificent Hommaru Palace were operated as a military facility. Nagoya Castle was Japan's first castle to be designated a National Treasure. Even after wartime air raid destruction, it was deemed historically important enough to be designated a National Historic Site. Restoration work being carried out is returning Nagoya Castle to original condition.

#### ◆Mandara (Lunch)◆

A Japanese restaurant near Nagoya Castle. Let's enjoy Nagoya's specialty, Kishimen. Officially Kishimen is a type of Udon noodle that you may be familiar with, simply made from water, wheat, and salt. While the noodles themselves may be simple, that makes them great for a mixture of different sauces and soups to go along with it. Traditionally, Kishimen is served in a hot broth with various ingredients such as spinach, steamed fish cakes, deep-fried bean curd, topped off with some spring onion, and dry bonito flakes.

Shuzi Hayase (Univ. Electro-Communications, Japan)

The certified efficiency of the Pb perovskite solar cell is 25.5 % and is approaching the 26.7% of the single crystalline Si solar cells. It is incredible that the high efficiency was achieved by the cell prepared with a simple low temperature-printing process, where a lot of impurities should remain in the film. The fundamental for the high efficiency is discussed from the viewpoint of the defect tolerance properties. In addition, the recent research trends of the perovskite tandem cells and Pb free perovskite solar cells are reviewed, and the issues to be solved are disclosed. The enhancement of the efficiency for the Sn and SnPb perovskite solar cells expected as the

perovskite tandem cells is discussed, while comparing it with the Pb perovskite. Finally, the new applications of these solar cells are reviewed.

## Special Events

### (1) NEDO Project Special Exhibition (Event Hall, Nov. 15-16)

We will exhibit the Toyota Prius PHV and Nissan eNV200, which are experimental vehicles equipped with high-efficiency triple-junction compound solar cells developed by Sharp as part of a NEDO project.

June 6, 2022

Sharp achieves world's highest conversion efficiency of 32.65% in a lightweight, flexible, practically sized solar module.

July 4, 2019

NEDO, Sharp, and Toyota to begin public road trials of electrified vehicles equipped with high-efficiency solar batteries.

July 6, 2020

Solar panels manufactured by Sharp (31.17%) for electrified vehicles.

### (2) Solar Car Exhibition (Event Hall, Nov. 15-16)

NITech Solar Car Club will exhibit their solar car.

From the applied research at the Umeno Laboratory (Emeritus professor Masayoshi Umeno, Honorary member of PVSEC International Advisory Committee), the NITech Solar Car Club started in 1995.

The solar car they are developing is the ultimate eco-car, which is actually driven by a human and runs solely on the solar energy. However, since the energy of sunlight varies depending on the weather and time of day, the obtained energy is not constant, and the energy consumed by the motor also changes depending on the resistance of the vehicle body and the running speed. When developing a solar car, it is necessary to efficiently convert sunlight into electricity and drive with lower fuel consumption. In general, they aim to meet these requirements by using highly efficient

solar panels, reducing air resistance and vehicle weight.

The solar car race is a so-called "endurance race". Energy management holds the key to victory during the race, and energy management tactics are what make solar car racing so interesting. NITech Solar Car Club participates in the "FIA Electric & New Energy Championship Solar Car Race Suzuka (the highest class in Japan)" held at Suzuka Circuit and the "Bridgestone World Solar Challenge (the world's highest class)" held in Australia.

(3) Networking lunch for women in photovoltaics  
(Rooms 431 and 432, Nov. 15, 12:30-13:30)

Admission is charged with pre-registration.

Style: Hybrid (Onsite & Zoom)

Onsite participation includes a lunch box (Regular or Vegetarian).

This event would be good opportunity for young women in this field to feel closer to senior women (role models) working in the field of photovoltaics and also good opportunity for all participants for networking.

Main schedule

- \* Presentation from role models (women working in the field of photovoltaics etc.) during lunch time.
- \* Free talking with participants (e.g. ~6 persons/group) after lunch time.

(4) Early Career Jobs Fair

(Event Hall, Nov. 15: 10:30-17:00, Nov. 16: 10:30-15:00)

PVSEC-33 provides the opportunity of job hunting for PhD students or young researchers. You can find the information on jobs related with photovoltaics there. PVSEC-33 also provides a place where the company's HR staff can interview job seekers directly.

## IEA PVPS workshops at PVSEC-33 –Nagoya, Japan

- Organizer : IEA PVPS
- Supporting organization : NEDO
- Date :Tuesday, 15th Nov., 2022
- Venue : 131/132, 3F, 1st Bldg., Nagoya Congress Center (Onsite only)
- Participants need to register PVSEC-33 For more details : <https://pvsec-33.com/index.html>

### **10:30 - 12:00 Task 1 Workshop: “Enablers of emerging PV technologies”**

**Session Chair:** Arnulf Jäger-Waldau, EC JRC, Task 1 and Task 14 expert of IEA PVPS

**Description:** PV cumulative capacity reached 1TW in 2022 and PV is expected contribute the pathway to achieve carbon neutral. In addition to conventional application such as ground mounted PV systems and rooftop PV systems, the markets of emerging application such as BIPV, VIPV, and FPV are expected to grow. However, obstacles and challenges of these application still remains. In this workshop, enablers of these technologies will be discussed from regulatory, policy and technological aspects.

#### **Planned Program:**

Gaëtan Masson, IEA PVPS Task 1 Manager/ Becquerel Institute, Belgium, “Trends of global PV market and emerging PV”

Daniel Mugnier, IEA PVPS Chair/TECSOL, France, “French approach to promote BIPV”

Kazuhiko Umeda, Taisei Corporation, Japan, “Architectural issues and introduction of the latest technology of BIPV in Japan”

Izumi KAIZUKA, RTS Corporation, Japan, “Floating PV trends”

## **15:30 - 17:00 Task 17 Workshop: “PV contribution to the transport sector”**

**Session Chair:** Keiichi Komoto, MHRT, Task 17 Task Manager

**Description:** A potential of PV market in the transport will be large, and the market will be the next driving force for the further development of PV. In order to mitigate CO<sub>2</sub> emission in the transport sector, promoting electrified vehicles is suggested as an effective option. Taking into account the WTW emissions, a mutual exploitation of PV and electrified vehicles with battery should be a key, as well as for deployment of PV in the transport. In this workshop, expected impacts and requirements for possible options; VIPV (vehicle integrated PV) and PVSC (PV charging station) will be discussed.

### **Planned Program:**

Keiichi Komoto, MHRT, Japan, Introduction

Bonna K. Newman, TNO, the Netherlands, “Status of VIPV Technology in the Netherlands and Beyond”

Benjamin Commault, CEA, France, “On-board photovoltaic kit for Existing Vehicles”

Manuela Sechilariu, UTC, France, “DC microgrid powered EV charging station versus public grid powered EV charging station”

N. J. Ekins-Daukes, UNSW, Australia, “Electric bus charging using PV”

Kenji Araki, University of Miyazaki, Japan, “VIPV – Real performance and real benefit to society”

## **17:30 - 19:00 Task 12 Workshop: “PV recycling related research from IEA PVPS Task12: PV Sustainability”**

**Session Chair:** Garvin Heath, NREL, Task 12 Task Manager and Keiichi Komoto, MHRT, Task12 expert

**Description:** With PV deployment increasing exponentially, the number of PV modules that reach the end of useful life will also increase, accumulating proportionately as waste after the time lag of operation. When a product cannot be repaired or reused, recycling is the next preferable option before disposing as waste. PV module recycling has become an important emerging and strategic topic, with numerous global, regional, and country-specific activities conducted and developed by governments, organizations, and companies in recent years. In this workshop, a current status and a challenge to overcome will be discussed.

Garvin Heath, NREL, USA, “PV circularity and high value recycling of c-Si PV modules”

Yansong Shen, UNSW, Australia, “Metallurgy-inspired end of life solar panel recycling: process modelling and optimization”

Nicolas Defrenne, Soren, France, “EOL management of PV module in Europe (TBC)”

Keiichi Komoto, MHRT, Japan, “Current status of PV recycling in PVPS Task12 countries”

What is エリプソメーター?

分光エリプソメーターは、薄膜の厚み、光学定数(屈折率n、消衰係数k)および、表面や物質の微細構造を任意の波長範囲の偏光した光を利用して測定する、非破壊・非接触の大変感度の良い測定装置です。ある偏光状態の光を斜めから膜に当てると、反射した光は膜の作用により偏光の変化が起きます。光の強度に依存しない偏光の変化を測定するため、再現性がよく高感度な測定ができます。

# Increase power generation from your PV module

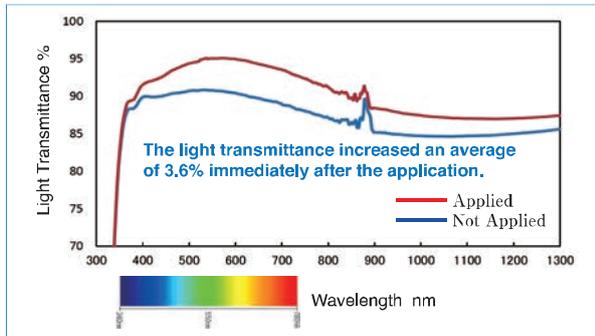

# EXCEL PURE

## Features of EXCEL PURE

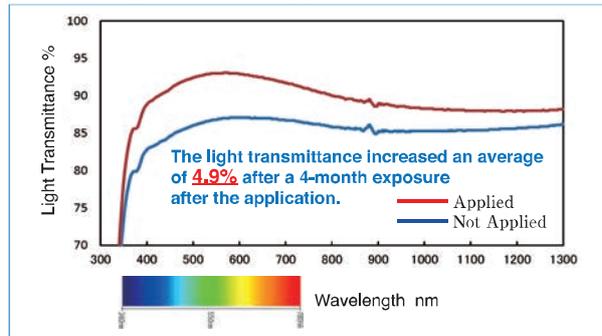

EXCEL PURE improves the light transmittance of cover glass for PV module immediately after application, and maintains its effect for a long period of time.

## Results of light transmittance measurement

### Initial Values

### 4-Month Exposure after Application

The light transmittance of cover glass for PV module coated by EXCEL PURE improves immediately after its application. Also, after application, contaminants are prevented from attaching to glass surface due to the excellent anti-fouling effect of EXCEL PURE. As the result, glass surface is kept clean and a decrease of light transmittance by contaminants is prevented as well.

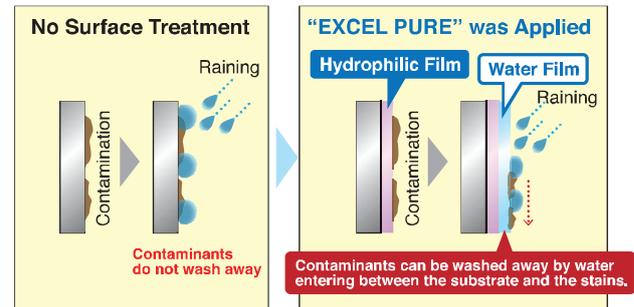

## Features of EXCEL PURE

Excellent antifouling performance is exhibited due to the hydrophilic film coating.

### Formation of Hydrophilic Coating Film

### Self-Cleaning Effect

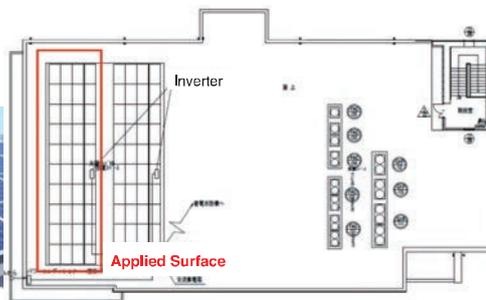

EXCEL PURE forms hydrophilic coating film on the surface of substrate. Water droplets on coating film become thin water film due to the hydrophilicity. Water film flows into gap between surface of substrate and contaminants to make contaminants float and wash away.

## Verification Test

EXCEL PURE was applied to PV modules installed on the roof of a building, and the power generation was compared with that of the non-applied PV modules.

Date of Measurement : April 8, 2014  
 Start of Measurement : April 9, 2014  
 Number of Applied PV modules : 40  
 Number of Non-Applied PV modules : 40

Power Generation Difference (kW) Each Month			
	Non-Applied Area (1)	Applied Area (2)	(2)/(1)
Before Application	322	326	101.2%
Apr-14	828	860	103.8%

Nov-14	429	452	105.3%
Dec-14	200	209	104.4%
Jan-15	270	290	107.4%

Mar-15	695	732	105.4%
<b>Total</b>	<b>8073</b>	<b>8427</b>	<b>104.4%</b>

The difference in power generation became large immediately after application. The power generation of the applied PV modules increased 3.2% on an annual average (B)-(A).
